

MA511: Computer Programming

Practice Lab 2(Due: 26th Aug 2025)

To execute these labs, you will only use the tools/techniques we have discussed in class.

1. Write 2 different C functions to compute area and perimeter of a triangle whose sides a, b, and c are given by user as inputs. Use extern/global variables to share information. Write the program using three different files
 - file1: contains main()
 - file2: contains function to compute area
 - file3: contains function to compute perimeter
2. Write a function to find the running total of numbers passed to it across 5 function calls, using a static variable to retain the total.

Sample output:

Enter 5 numbers

1

Total: 1 2

Total: 3 3

Total: 6 4

Total: 10 5

Total: 15

3. Write a C function to build a simple calculator using two files as follows.
 - `main.c`: Displays menu, accepts user choice and numbers.
 - `arithmetic.c`: Functions for addition, subtraction, multiplication, division.
